GD32207i-EVAL
FreeRTOS
Getting Started Guide

Revision 1.1

(June 2020)

Getting started with the GD32207i-EVAL

This tutorial provides instructions for getting started with the GigaDevice GD32207i-EVAL board. If you do not already have the GigaDevice GD32207i-EVAL board, visit the [GigaDevice website](#) to purchase one.

Before you begin, you must configure AWS IoT and your FreeRTOS software to connect your development board to the AWS Cloud. For instructions, see [First steps](#) in FreeRTOS User Guide. Then download [FreeRTOS code](#) for GigaDevice from GitHub. In this tutorial, the path to the FreeRTOS download directory is referred to as `<amazon-freertos>`.

Overview

This tutorial guides you through the following steps:

1. Install software on your host machine for developing and debugging embedded applications for your microcontroller board.
2. Compile the FreeRTOS demos application.
3. Set up GD32207i-EVAL board.
4. Load the application image to your board and run the application.

Set Up Your Development Environment

Using Keil MDK v5 to compile FreeRTOS demos for GD32207i-EVAL board. You can download Keil MDK v5 at [Keil MDK](#) website. The Keil MDK v5 Essential, Plus, or Pro version should also work for the GD32F20x (Cortex-M3 core) MCU.

To install the development tool for the GD32207i-EVAL board

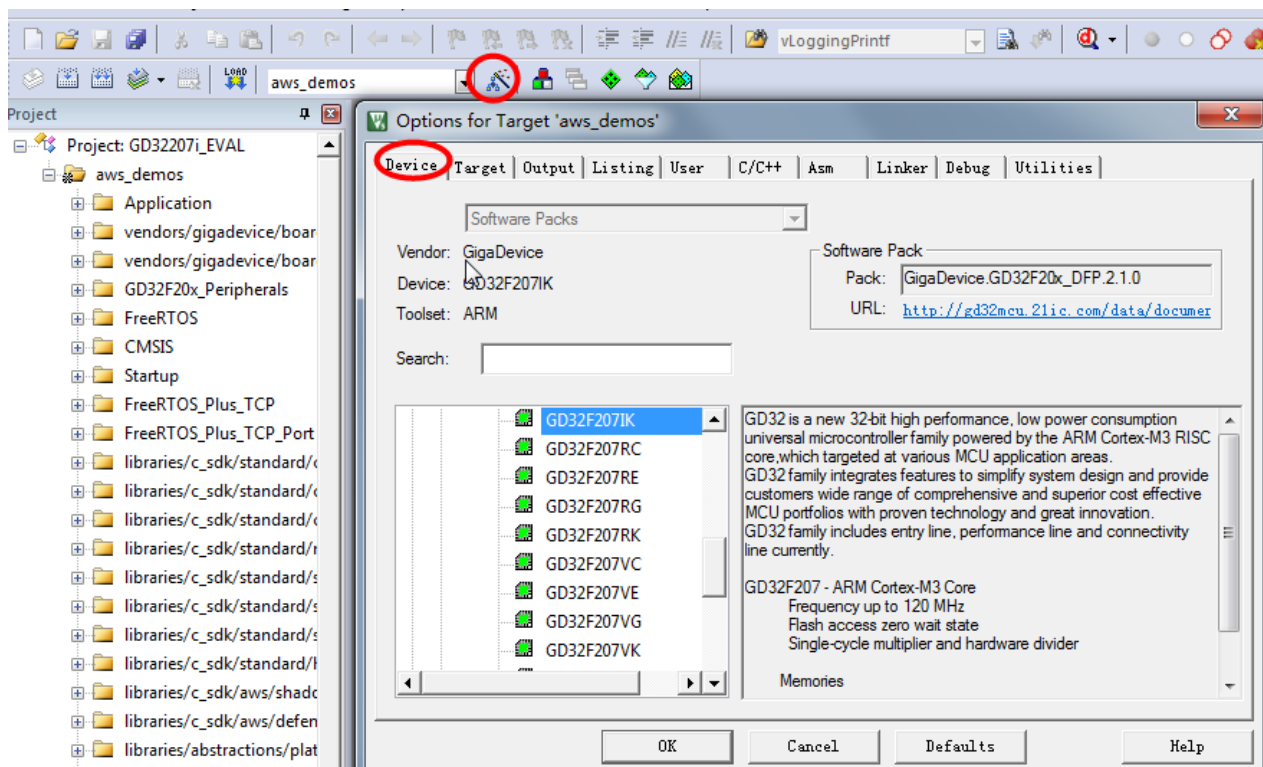

1. Download the Keil MDK.
2. Install the Keil MDK on your host machine by using your license. The Keil MDK includes the Keil µVision IDE, a C/C++ compilation toolchain, and the µVision debugger.
3. Install the GD32F20x Series Pack file from Pack Installer window of Keil IDE, you can also get pack file from the GigaDevice website.

Set up GD32207i-EVAL board correctly

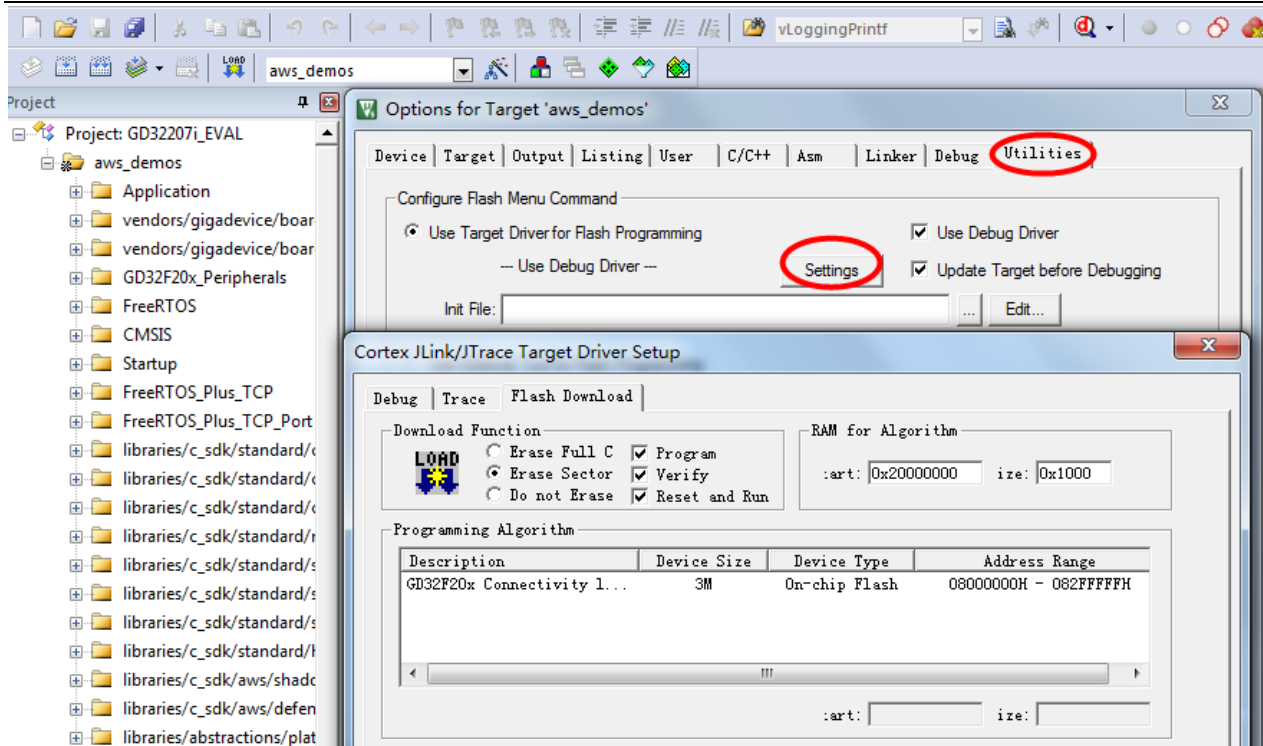

Make sure the jumper cap on the development board is set correctly. JP18, JP19, JP20, JP22, JP23 jump to 'Eth'. JP5 jump to 'USART0'.

Build the FreeRTOS Demo Project

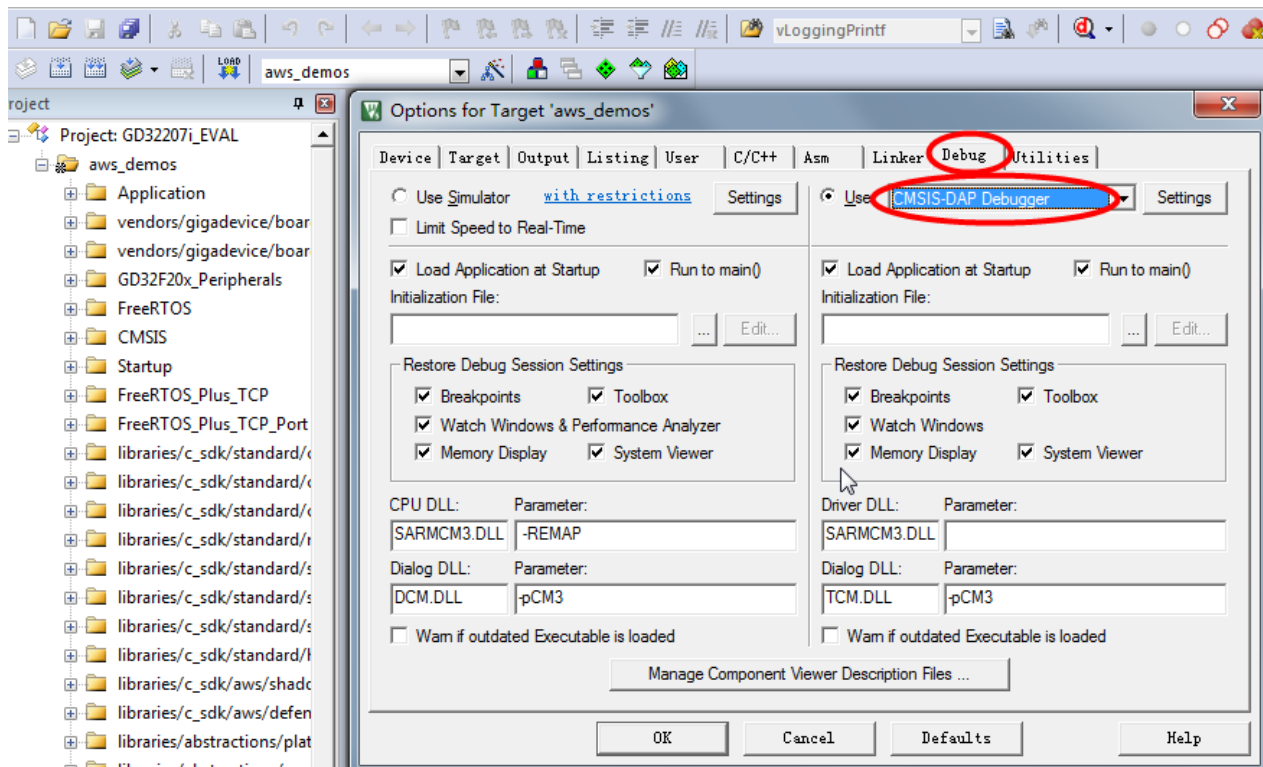

1. Make sure the Keil MDK v5 is installed correctly.
2. Open aws_demos folder in the *<amazon-freertos> \ projects \ gigadevice \ gd32207i_eval \ uvision* directory.
3. Double click GD32207i_EVAL.uvprojx project file to open demo project.
4. To make sure that your settings are correct to flash the chip, click the 'Options for Target' in the project navigation pane.
5. On the 'Device' tab, verify the chip type is set to GD32F207IK.

6. On the 'Utilities' tab, verify that 'Use Target Driver for Flash Programming' is selected, then click 'Settings' and verify Programming Algorithm was chosen to 'GD32F20x Connectivity line FMC'.

- On the 'Debug' tab, you can select the corresponding debugger as required. The default debugger is CMSIS-DAP Debugger.

- Click 'Build' button in the project navigation pane after the above operations are completed.

Run the FreeRTOS Demo Project

- Click the 'Download' button in the project navigation pane to flash the program to the GD32207i-

EVAL board after the correct compilation.

2. You can view the demo running result through the serial port.

To subscribe to the MQTT topic with the AWS IoT MQTT client

You can use the MQTT client in the AWS IoT console to monitor the messages that your device sends to the AWS Cloud

1. Sign in to the [AWS IoT console](#).
2. In the navigation pane, choose 'Test' to open the MQTT client.
3. In 'Subscription topic', enter `iotdemo/#`, and then choose 'Subscribe to topic'.

The screenshot shows the AWS IoT console interface. On the left is a navigation pane with options: 监控, 入门培训, 管理, Greengrass, 安全, 防护, 行动, 测试 (highlighted), 软件, 设置, 学习. The main area is titled 'MQTT 客户端' and shows a subscription configuration form. The '订阅主题' (Subscription topic) field is set to 'iotdemo/topic/1'. Below it, '最大消息捕获' (Maximum message capture) is set to 100. There are radio buttons for '服务质量' (Quality of Service): 0 (selected) and 1. There are also radio buttons for 'MQTT 负载显示' (MQTT payload display): 自动格式化 JSON 负载 (提高可读性) (selected), 以字符串形式显示负载 (更准确), and 显示原始负载 (十六进制). At the bottom, there is a '发布' (Publish) section with a text input for the topic and a '发布到主题' (Publish to topic) button.

The screenshot shows the same AWS IoT console interface, but now displaying the message history for the subscription 'iotdemo/topic/1'. The left sidebar is the same. The main area shows a list of messages received. The first message is 'Hello world 12!'. The second message is a JSON payload: `{ "message": "Hello from AWS IoT console" }`. The third message is 'Hello world 8!'. The fourth message is 'Hello world 4!'. Each message entry includes the topic 'iotdemo/topic/1' and the timestamp '2020年5月13日 上午10:56:04 +0800'. There are '导出' (Export) and '隐藏' (Hide) buttons for each message. A green banner at the bottom of the message list states: '我们无法以 JSON 格式显示消息，转而以 UTF-8 字符串形式显示。' (We cannot display the message in JSON format, so it is displayed in UTF-8 string format.)
